Completion and efficiency

Huh, what?

# Data metrics

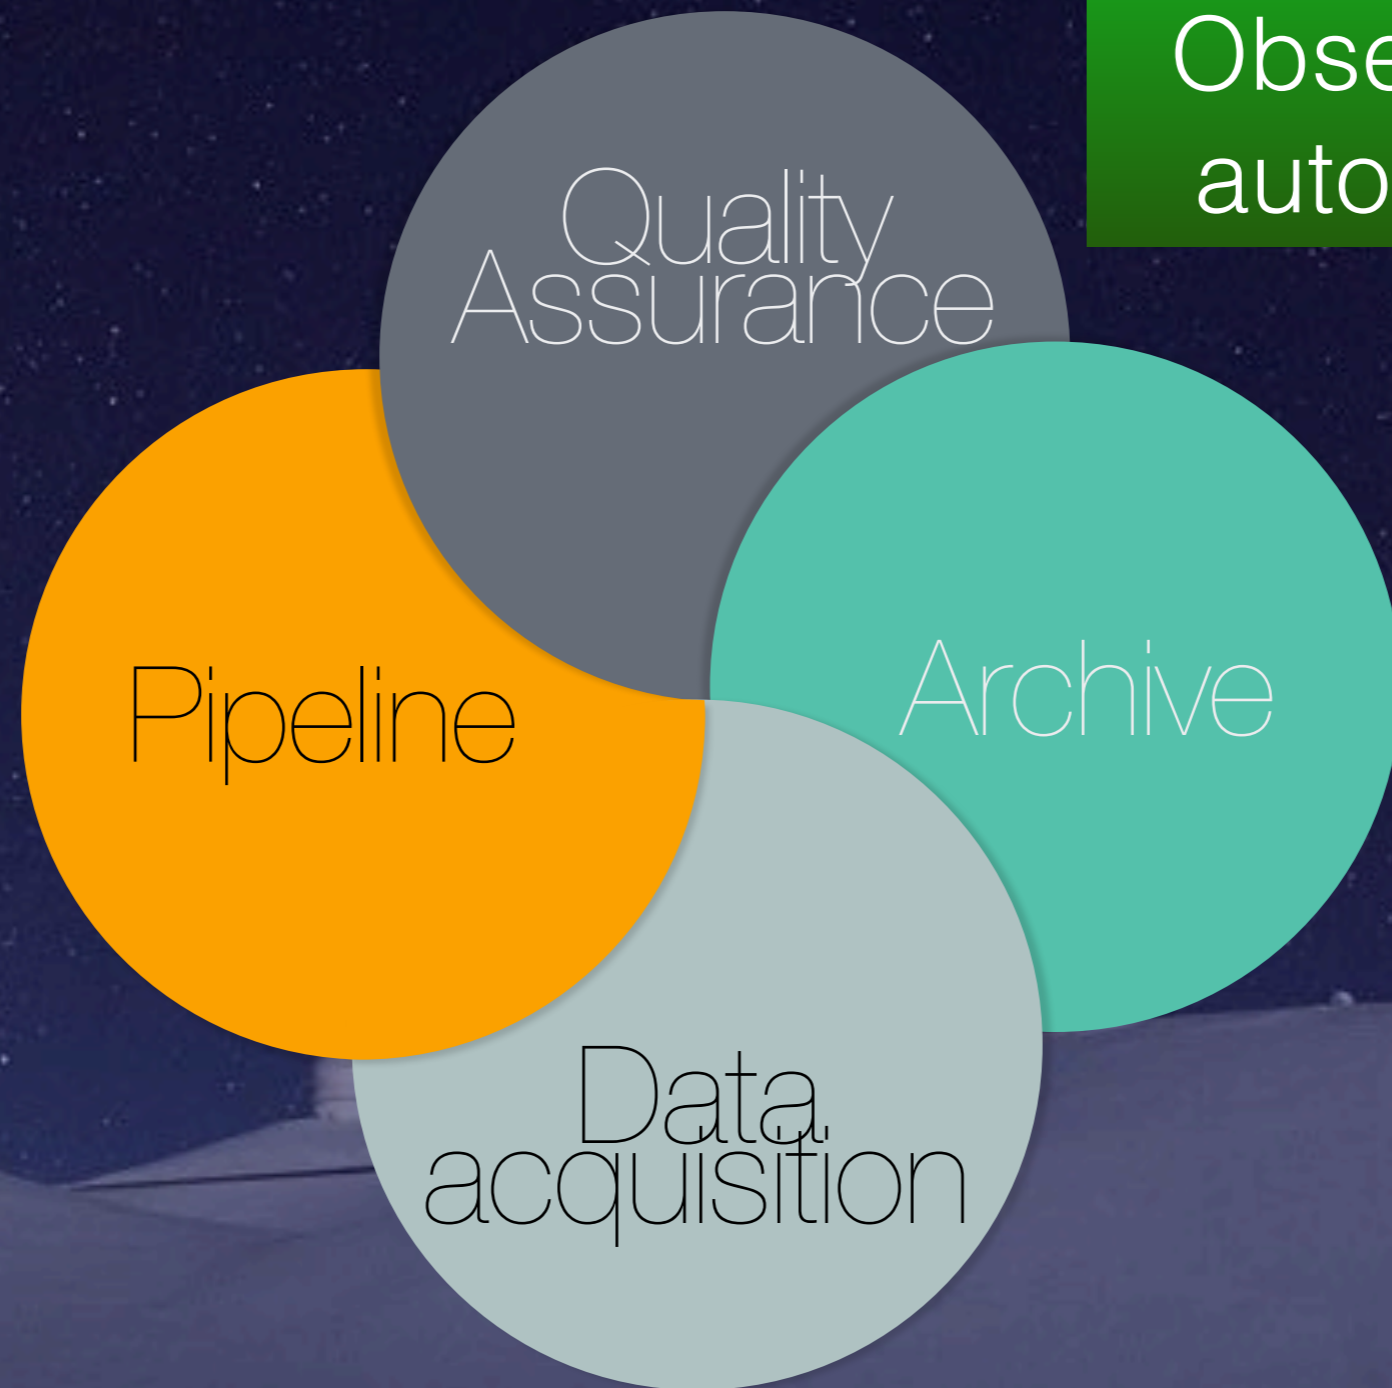

# Data metrics

What fraction of papers?

# Data metrics

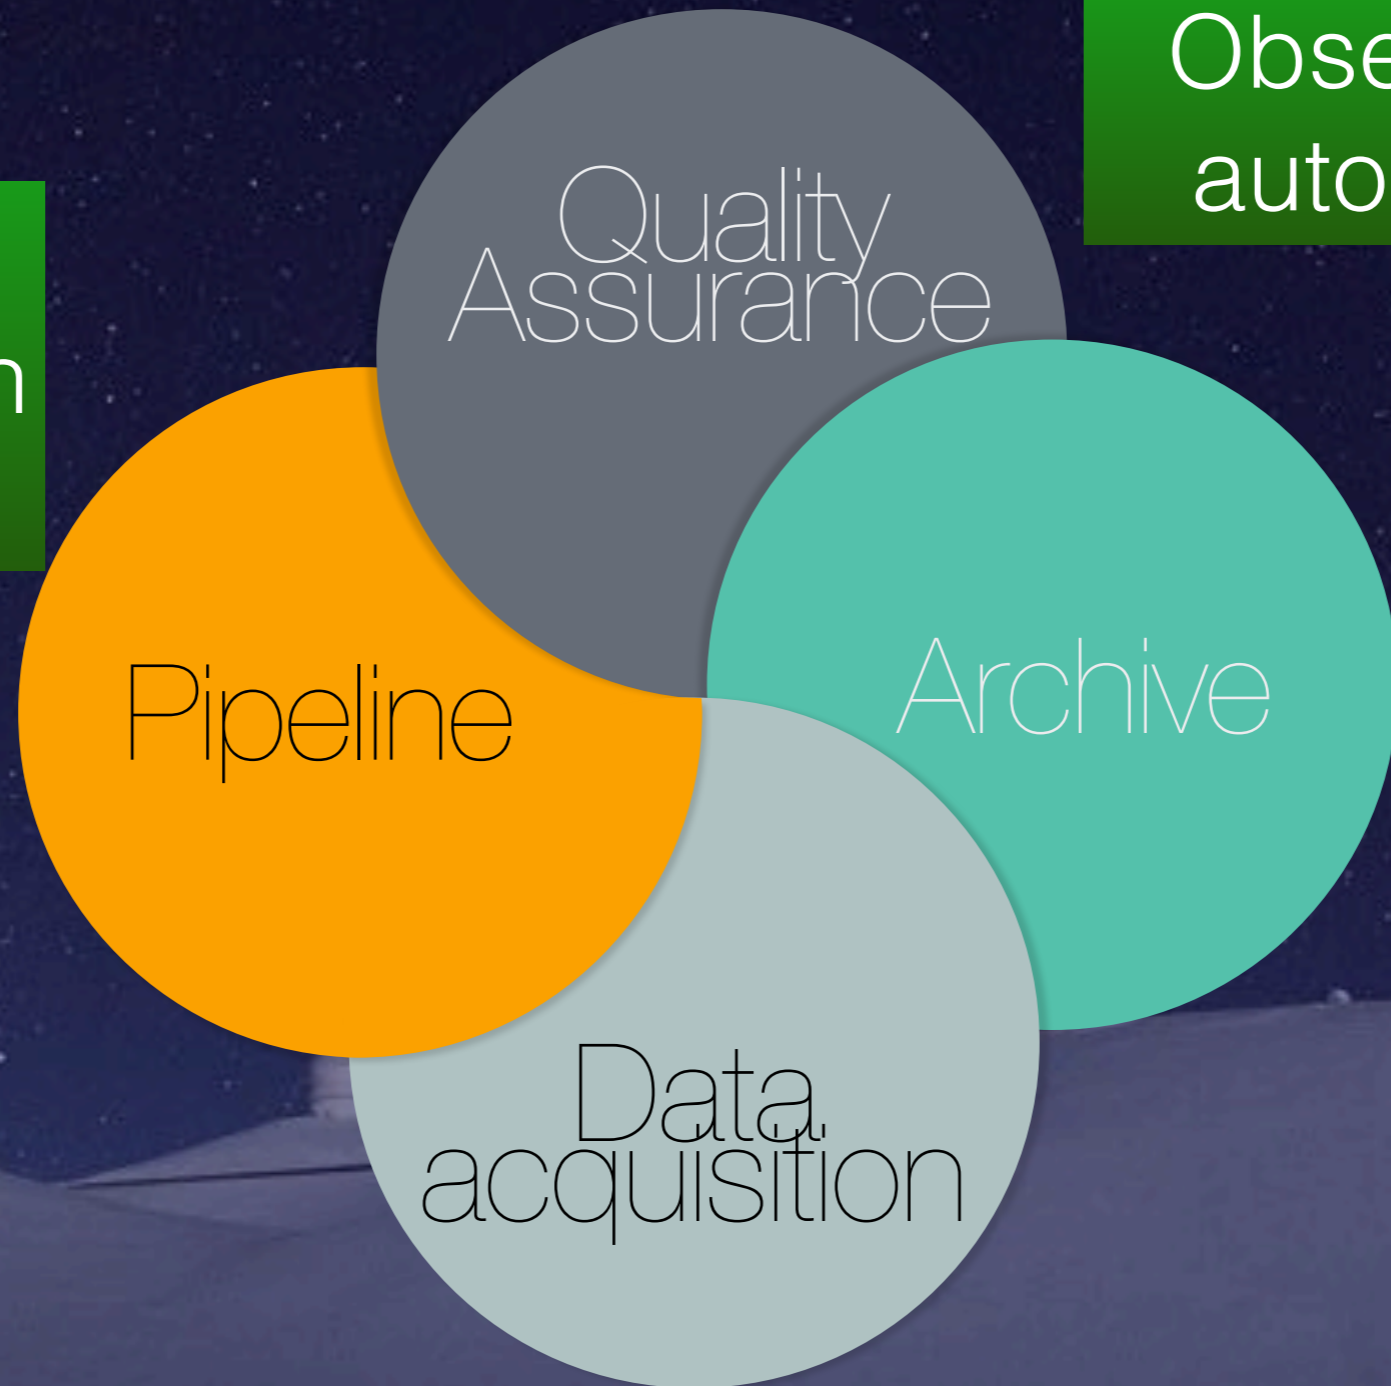

Observer vs  
automation

What  
fraction of  
papers?

# Data metrics

Strongly dependent on flex/classic

Observer vs automation

What fraction of papers?

# Data metrics

Strongly dependent on flex/classic

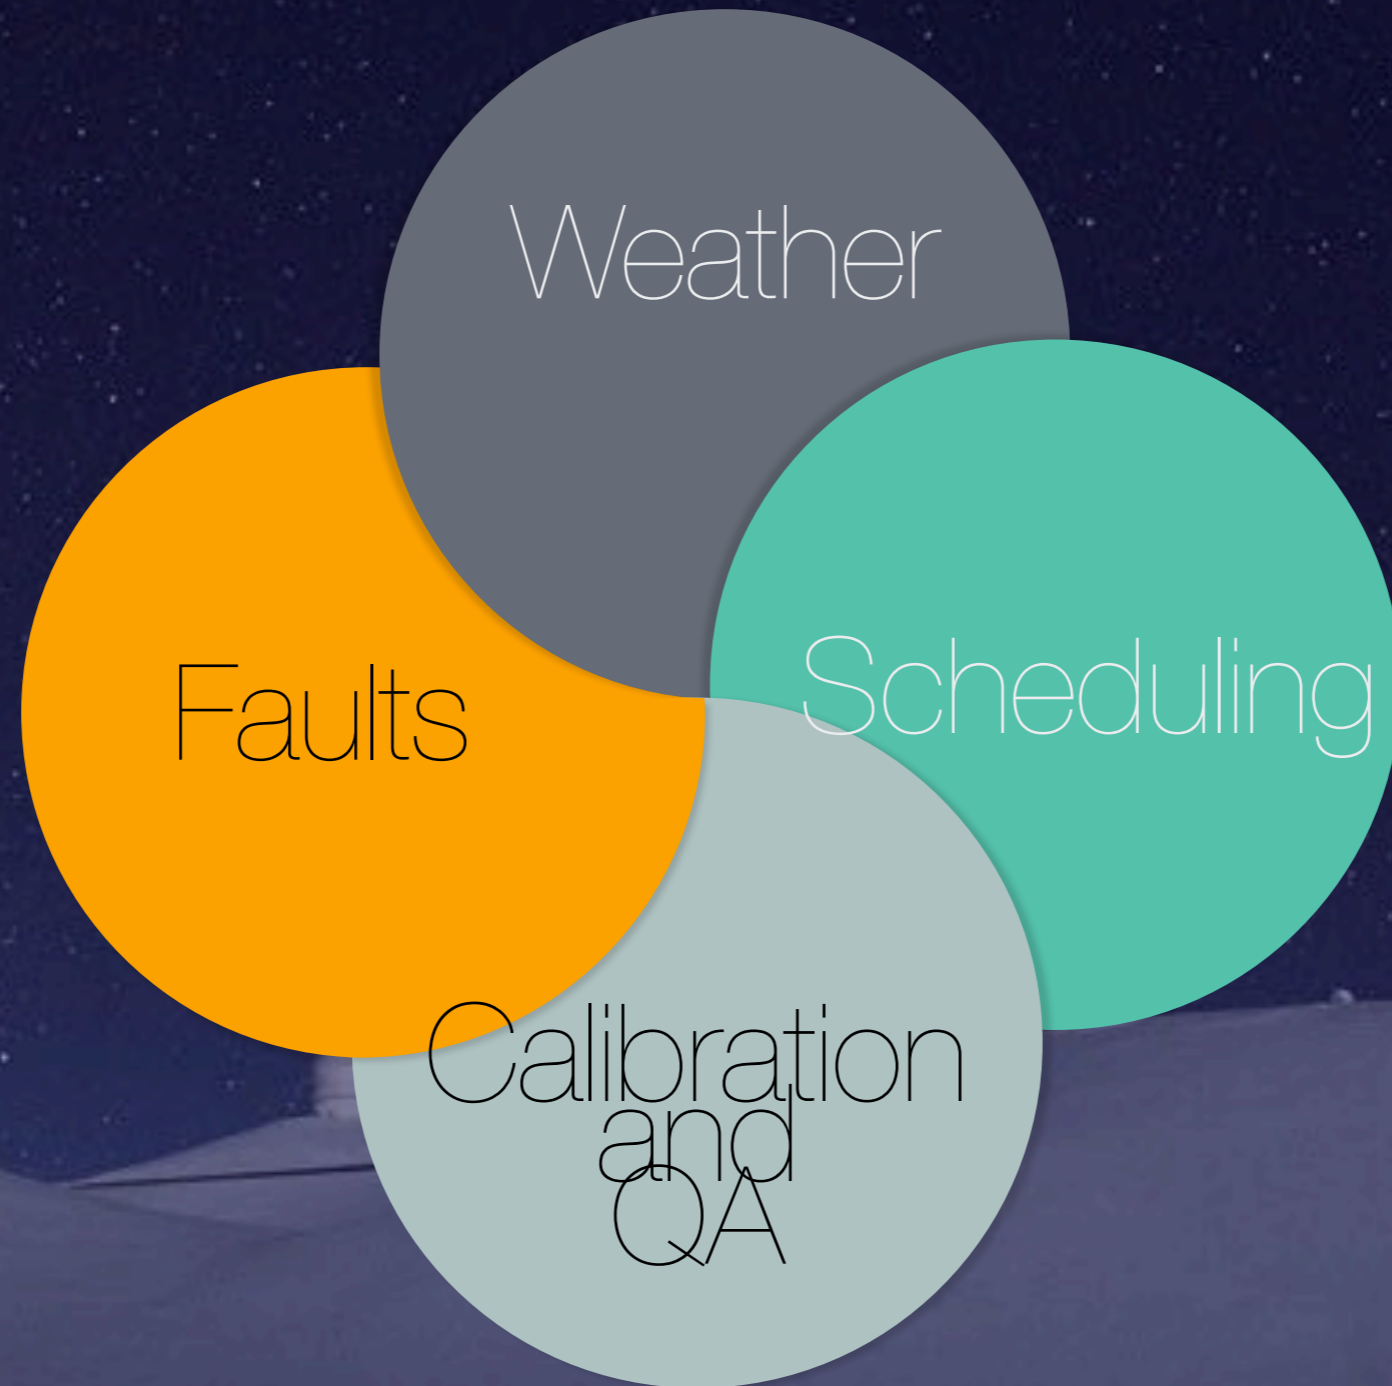

Observer vs automation

What fraction of papers?

High rates make real-time analysis challenging

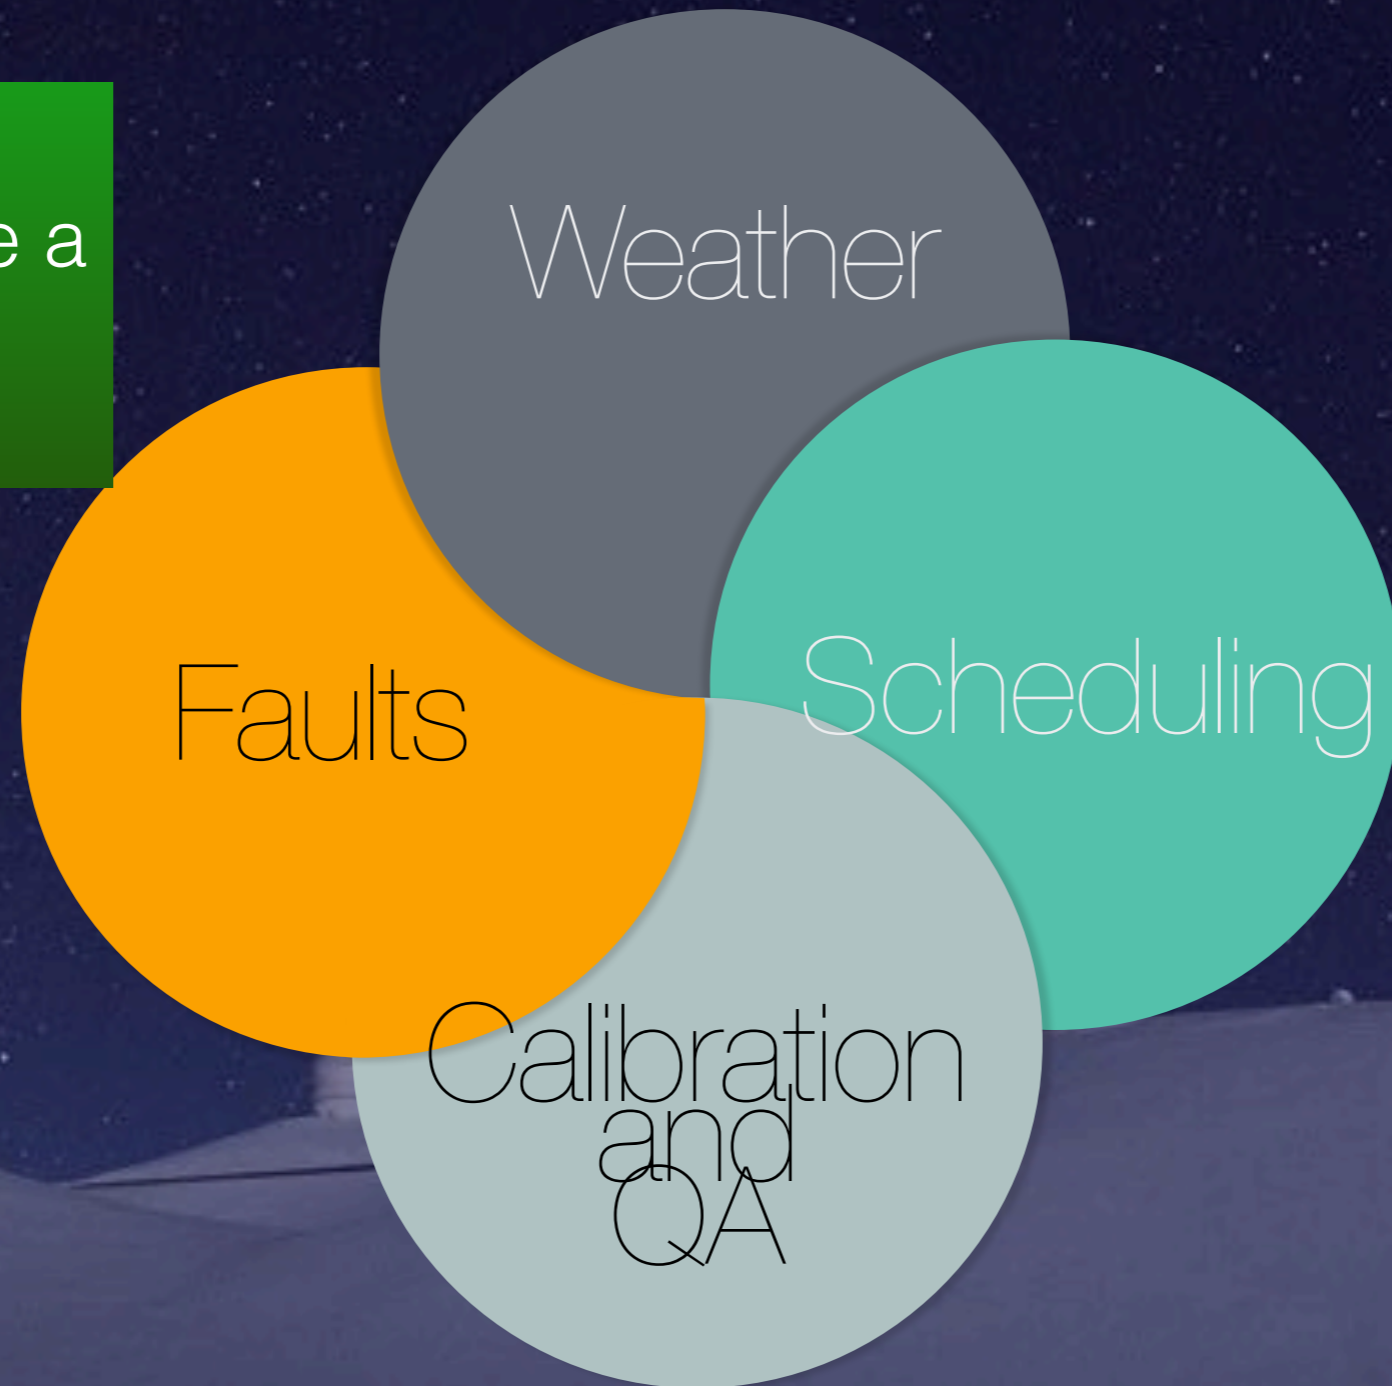

# Operations metrics

# Operations metrics

Only half the observatories use a database fault system

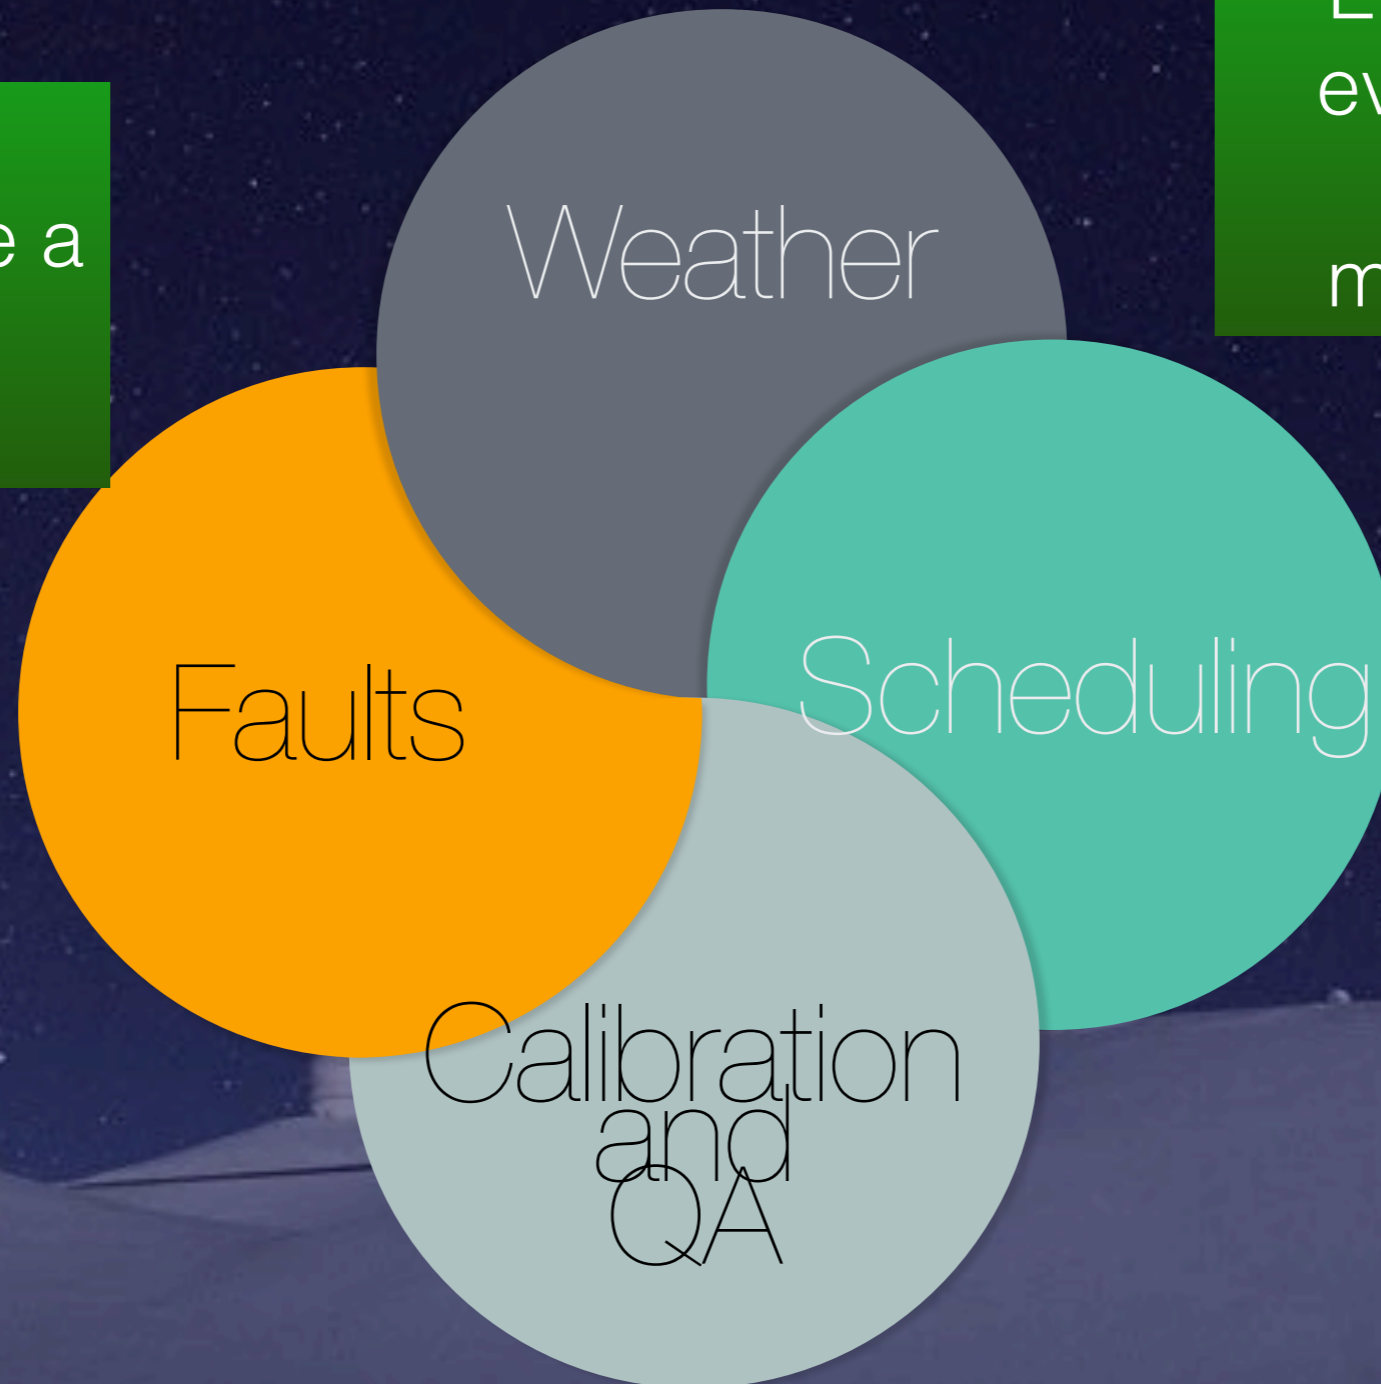

# Operations metrics

Everyone uses  
everyone else's  
weather  
measurements

Only half the  
observatories use a  
database fault  
system

Calibration  
and  
QA

Faults

Scheduling

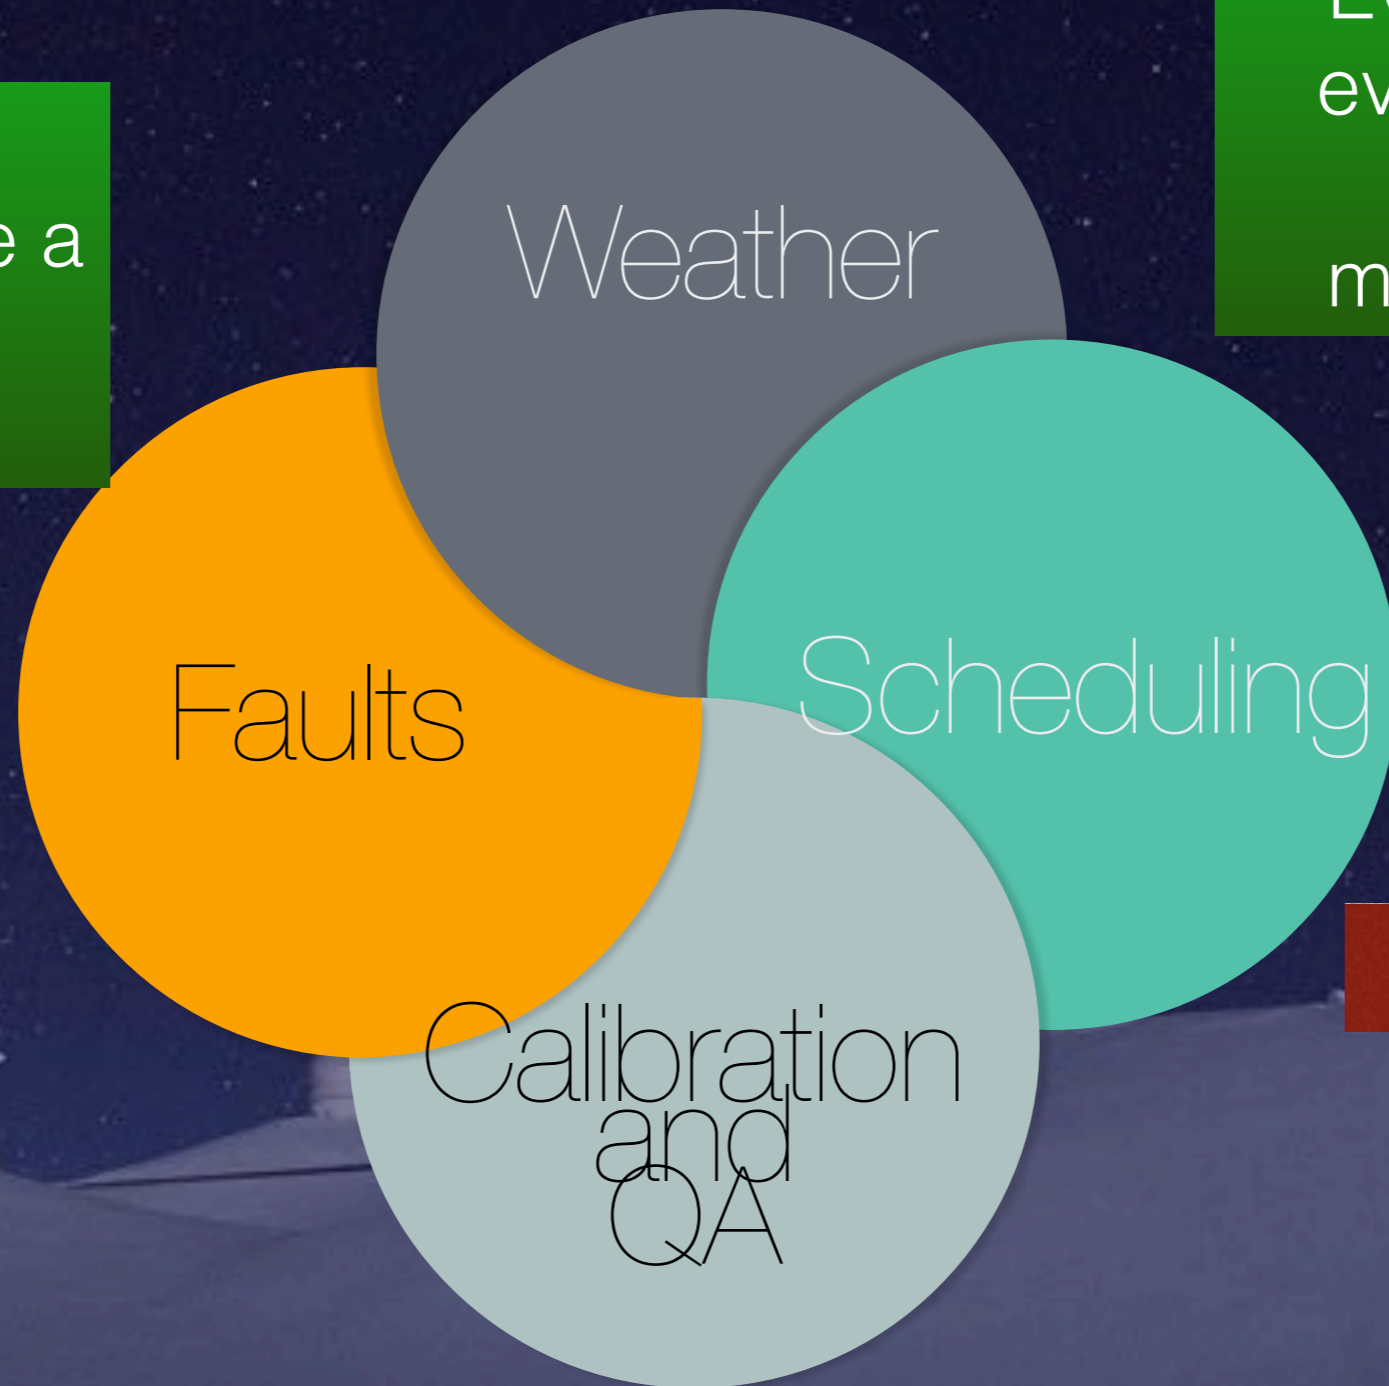

Weather

# Operations metrics

Everyone uses  
everyone else's  
weather  
measurements

Only half the  
observatories use a  
database fault  
system

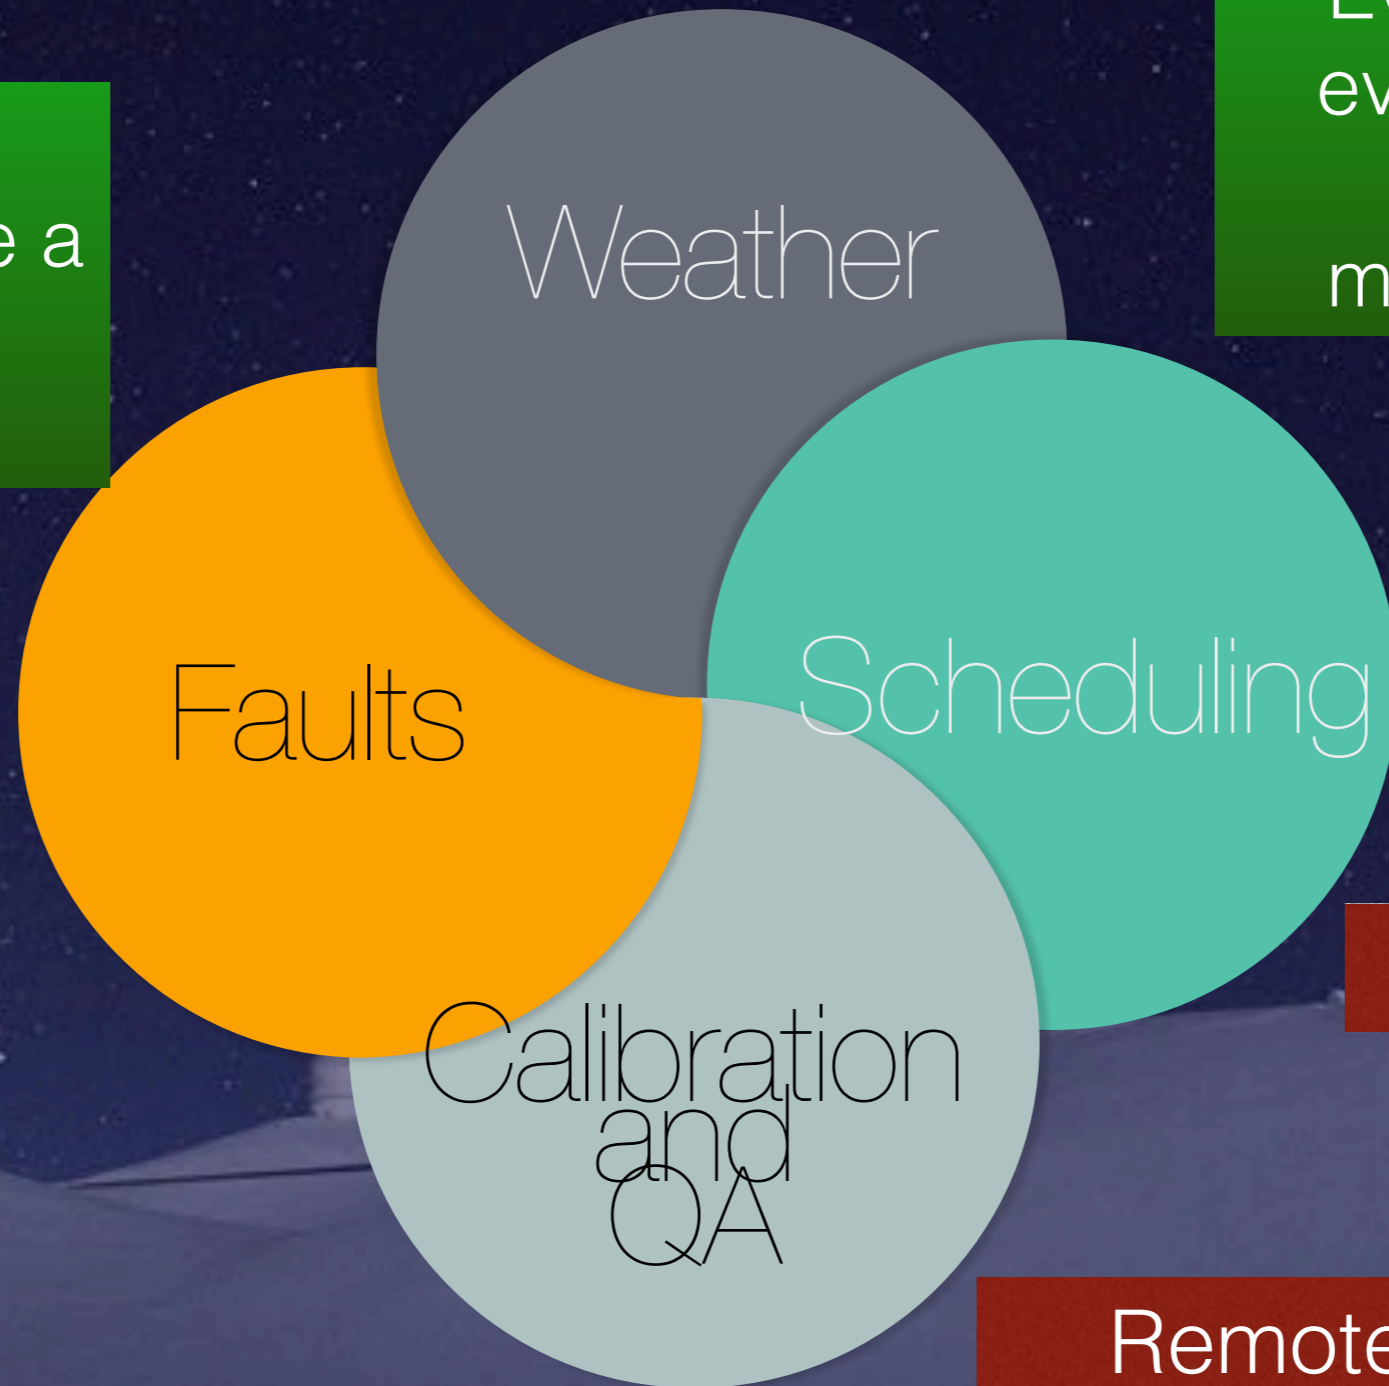

Flex or queue?

# Operations metrics

Only half the observatories use a database fault system

Everyone uses everyone else's weather measurements

Flex or queue?

Remote or summit?

Remote operations - all observatories either are in full/partial remote operations or planning on it

Nearly even split between flex (queue) observing and classical scheduling

# Faults and efficiency

About half of MK telescopes report using a database (searchable) fault reporting system

Value return is not just in keeping fault rates low ( $<3\%$ ) but for training, historical tracking, redundancy

Highest time losses reported are in instrument downtime, dome/shutter failures... and software
